A **formal context** is a triple $\mathbb{K} = (G, M, I)$ consisting of

- a set G of **objects**
- a set M of **attributes**
- an incidence relation $I \subseteq G \times M$

Maps on a Formal Context

Two maps are associated with each formal context.

- 1 Each attribute set $B \subseteq M$ defines a set of objects.

$$(\cdot)^{\downarrow} : \mathfrak{P}(M) \rightarrow \mathfrak{P}(G)$$

$$B^{\downarrow} := \{g \in G \mid (g, m) \in I \text{ for all } m \in B\}$$

- 2 “What do the objects of $A \subseteq G$ have in common?”

$$(\cdot)^{\uparrow} : \mathfrak{P}(G) \rightarrow \mathfrak{P}(M)$$

$$A^{\uparrow} := \{m \in M \mid (g, m) \in I \text{ for all } g \in A\}$$

References

The maps $(\cdot)^\uparrow$ and $(\cdot)^\downarrow$ form an antitone Galois connection between the power set lattices $(\mathfrak{P}(G), \subseteq)$ and $(\mathfrak{P}(M), \subseteq)$.

- $A_1 \subseteq A_2 \Rightarrow A_2^\uparrow \subseteq A_1^\uparrow$
- $B_1 \subseteq B_2 \Rightarrow B_2^\downarrow \subseteq B_1^\downarrow$
- $A \subseteq A^{\uparrow\downarrow}$
- $B \subseteq B^{\downarrow\uparrow}$

The image of each map forms a closure system.

Concept Lattice

Conjunctive
Concept
Algebras

The closure systems of an antitone Galois connection are dually isomorphic. Pairing them up results in the **concept lattice** of $\mathbb{K}$:

$$\mathfrak{B}(\mathbb{K}) := \{(A, B) \in \mathfrak{P}(G) \times \mathfrak{P}(M) \mid A^\uparrow = B \text{ and } B^\downarrow = A\}.$$

We call A the **extent** and B the **intent** of a concept (A, B) .

The maps $(\cdot)^\uparrow$ and $(\cdot)^\downarrow$ are supremum-reversing, i.e.

$$(A_1 \cup A_2)^\uparrow = A_1^\uparrow \cap A_2^\uparrow,$$

$$(B_1 \cup B_2)^\downarrow = B_1^\downarrow \cap B_2^\downarrow,$$

and likewise for arbitrary unions.

Galois Connections between Complete Lattices

A map $f : U \rightarrow V$ between complete lattices has a dual adjoint if and only if it is supremum-reversing, i.e.

$$f\left(\bigvee_{i \in I} u_i\right) = \bigwedge_{i \in I} f(u_i).$$

References

- A finite attribute set $B \subseteq M$ represents a formula, e.g.
 $\{\text{black_hair}, \text{female}\} \hat{=} \text{black_hair}(x) \wedge \text{female}(x)$.
- Each attribute is considered to be a unary relation symbol.
- Formulas are conjunctions of atoms in a single variable x .
- The structural representation of formulas by attribute sets provides an infinitary logic (only relevant for infinite $\mathbb{K}$).
- The concept extents are the definable object sets in this logic.

Motivation: FCA with Relations

Generalize the approach to primitive-positive formulas (i.e. different variables, relation symbols of any arity, using $\wedge$ and $\exists$).

An **atomic formula** or **atom** over M is either:

- a **relational atom** $m(x_1, \dots, x_n)$
- an **equality atom** $x = y$

A **primitive-positive formula** over M is built from atoms using:

- the **conjunction** $\varphi \wedge \psi$
- the **existential quantification** $\exists x \varphi$

Notation

$PP(M)$: The set of primitive-positive formulas over M

Conjunctive Queries

Logical Representation

A **conjunctive query** is a primitive-positive formula. The **result table** for a conjunctive query φ in an M -structure $\mathfrak{G}$ is the set

$$\text{res}_{\mathfrak{G}}(\varphi) := \{t \in G^{\text{free}(\varphi)} \mid \mathfrak{G} \models \varphi[t]\}.$$

Example

Conjunctive Query

$\exists z (\text{mother}(x, z) \wedge \text{parent}(z, y))$

$\text{res}_{\mathfrak{G}_{\text{fam}}}$

Result Table

A table is a set $T \subseteq G^X$ where

- G is the set of permitted **table entries**
- $X \subseteq \mathbf{var}$ is a finite set of **column names**
- each **row** $t \in T$ is a map $t : X \rightarrow G$

The tables with entries in G are collected in the set

$$\text{Tab}(G) = \bigcup_{X \subseteq_{\text{fin}} \mathbf{var}} \wp(G^X)$$

Schema of a Table

- a **domain function** $\text{dom} : V \rightarrow \mathfrak{P}_{\text{fin}}(\text{var}) \cup \{\text{var}\}$

Projectional Semilattice Axioms

(PS0) $(V, \wedge, 0, 1)$ bounded semilattice

(PS1) $c_x(0) = 0$

(PS2) $u \leq c_x(u)$

(PS3) $c_x(u \wedge c_x(v)) = c_x(u) \wedge c_x(v)$

(PS4) $c_x(c_y(u)) = c_y(c_x(u))$

(PS5) $u \neq 0 \Rightarrow (u \neq c_x(u) \Leftrightarrow u \leq d_{xx})$

(PS6) $x \neq y, z \Rightarrow d_{yz} = c_x(d_{yx} \wedge d_{xz})$

(PS7) $x \neq y \Rightarrow d_{xy} \wedge c_x(d_{xy} \wedge u) \leq u$

(PS8) $u \neq 0 \Rightarrow \text{dom}(u)$ finite

(PS9) $\text{dom}(u) = \{x \in \text{var} \mid u \leq d_{xx}\}$

(PS10) $\text{dom}(u) = \emptyset \Rightarrow u = 1$

(PS11) $d_{xx} \neq 0$

(PS12) $d_{xy} = d_{yx}$

Database Theory: Two perspectives on relations on a set G

1 Unnamed Perspective

- a relation has an **arity** $n \in \omega$
- it is a set of **ordered tuples** $(g_0, \dots, g_{n-1}) \in G^n$

2 Named Perspective

- a relation has a finite **schema** $I \subseteq \mathbf{att}$
- it is a set of **named tuples** $t : I \rightarrow G$

Relations as Tables (Example: Airport Departures)

Unnamed Perspective

0	1	2
LH104	Munich	12:15
LH1204	Basel	12:20
LH284	Bologna	12:30

Named Perspective

Flight	Destination	Departure
LH104	Munich	12:15
LH1204	Basel	12:20
LH284	Bologna	12:30

Column Deletion

A **deletion operation** $c_i : \text{Rel}(G) \rightarrow \text{Rel}(G)$ is defined by

$$c_i(R) := \begin{cases} \{t \circ \epsilon_i^n \mid t \in R\} & \text{if } i < \#R = n \in \omega \\ R & \text{otherwise} \end{cases}$$

for each $i \in \omega$, where $\epsilon_i : n \rightarrow n - 1$ is the map

$$\epsilon_i^n(\ell) := \begin{cases} \ell & \text{if } i < \ell \\ \ell + 1 & \text{otherwise} \end{cases}$$

Example: Column Deletion

R :	0	1	2	$c_0(R)$:	0	1	$c_1(R)$:	0	1	$c_2(R)$:	0	1
	a	b	c		b	c		a	c		a	b
	a	b	d		b	d		a	d		d	e
	d	e	f		e	f		d	f			

Column Insertion

An **insertion operation** $\eta_i : \text{Rel}(G) \rightarrow \text{Rel}(G)$ is defined by

$$\eta_i(R) := \begin{cases} \{t \in G^{n+1} \mid t \circ \epsilon_i^{n+1} \in R\} & \text{if } i \leq n = \#R \in \omega \\ R & \text{otherwise} \end{cases}$$

for each $i \in \omega$.

Example: Column Insertion ($G = \{a, b, c\}$)

R :	<table><tr><th>0</th></tr><tr><td>a</td></tr></table>	0	a	$\eta_0(R)$:	<table><tr><th>0</th><th>1</th></tr><tr><td>a</td><td>a</td></tr><tr><td>b</td><td>a</td></tr><tr><td>c</td><td>a</td></tr></table>	0	1	a	a	b	a	c	a	$\eta_1(R)$:	<table><tr><th>0</th><th>1</th></tr><tr><td>a</td><td>a</td></tr><tr><td>a</td><td>b</td></tr><tr><td>a</td><td>c</td></tr></table>	0	1	a	a	a	b	a	c
0																							
a

a	a																						
b	a																						
c	a																						
0	1																						
a	a																						
a	b																						
a	c																						

Diagonals

Conjunctive
Concept
Algebras

For all $i, j \in \omega$, the **diagonal** d_{ij} is the relation

$$d_{ij} = \{t \in G^{\max(i,j)+1} \mid t(i) = t(j)\}$$

Example: Column Insertion ($G = \{a, b\}$)

d_{00} :	0	d_{01} :	0	1	d_{11} :	0	1	d_{02} :	0	1	2
	a		a	a		a	a		a		
	b		a	b		a	b		a		
	b		b	b		a	b		b		
						b	b		b	b	b

Projectional Skeleton

Conjunctive
Concept
Algebras

A **projectional skeleton** is an algebra $(U, \wedge, 0, 1, c_i, \eta_i, d_{ij}, \#)_{i,j \in \omega}$ consisting of

- a **bounded semilattice** $(U, \wedge, 0, 1)$
- a **deletion** $c_i : U \rightarrow U$ for all $i \in \omega$
- an **insertion** $\eta_i : U \rightarrow U$ for all $i \in \omega$
- a **diagonal** $d_{ij} \in U$ for all $i, j \in \omega$
- an **arity function** $\# : U \rightarrow \omega \cup \{\omega\}$
